

Comendo mailFence

MailFence is a security product that gives you the opportunity to have your e-mails scanned externally by five commercial antivirus programmes.

Besides the antivirus programmes we use a so called Pre Virus Recognition System that focuses on the shape/layout of the e-mail.

In that way we will stop virus even before a signature-file has been released from the suppliers of the antivirus programmes.

MailFence gives you e-mail without virus

With MailFence you can feel even safer, because virus are being caught at the right time which means before they reach your systems and do any harm. The advantage of Comendo MailFence is that you have up to five commercial antivirus programmes that scan your in- and outgoing e-mails for virus and that we use the Pre Virus Recognition System.

What is the Pre Virus Recognition?

To explain what pre virus recognition is we first have to look at what happens when a new virus is discovered. As soon as a new virus is discovered the suppliers of the antivirus programmes start working intensely to figure out how to stop it. As soon as that is done, the virus is named and a signature file is being released.

Sometimes this takes a few hours sometimes it takes 24 or more. It often happens 4-24 hours after the virus has been discovered. Until the user has updated his antivirus programme with this file, the new virus has free access and can infect all not-updated computers. Pre Virus Recognition is a unique intelligent system that analyzes all e-mail and attached files. The system is, among other things looking for certain patterns and other significant features in the attached files and can in this way block suspicious e-mails. All blocked e-mails are being quarantined, but are easily released and sent to the original recipient. When an e-mail has been quarantined for 24 hours it will be scanned by our five individual virus scanners again. If it does not contain malicious code it is automatically forwarded to the original recipient.

mailFence contains:

- Scanning of all in- and outgoing e-mails
- Possibility of tagging of all e-mails (Infected or not)
- Mails with virus will be deleted
- Option to send a message to original receiver on infected e-mails
- Monthly report on which virus-infected e-mails that have been erased/stopped.
- Surveillance of all e-mails 24/7, 365 days a year.
- Weekly newsletter
